Preparation of Data Packages for EU ETS verification

CLIENT BAA
LOCATION Heathrow, Gatwick and Stansted
DATE August 2004
PROJECT Preparation of Data Packages for EU ETS verification

DESCRIPTION

Abricon supported the British Airports Association (BAA) to prepare their EU ETS data package for verification entailed ensuring that all required processes/emission sources are included and that sufficient information is provided to allow the data to be verified.

Due to variety of end users on each airport or "installation" (airlines, retailers etc) it was essential to identify all relevant emission sources that are included in the scheme and provide the required historical backup material for verification. Once that had been established, the BAA airports with an energy consumption figure over 20MW, which is the threshold set by the EU, had to be identified. As a result data packages for Heathrow, Gatwick and Stansted were prepared.
