

Energy and Carbon Policy and Strategy Advice

Energy savings are there for the taking, but so often we fail to take advantage of the opportunities. Why? Often the reason stems from a lack of commitment at the top of the organisation. This commitment can be ensured through the careful design of an Energy and Carbon Policy, which will then form the cornerstone of a programme of improvement to reduce energy use and carbon emissions. Abricon can help by working with you to design a policy tailored to your needs, which is both succinct yet effective in ensuring action, and furthermore is compatible with the wider environmental aims and aspirations of your organisation.

With the Policy in place, Abricon can offer further help in the design and implementation of an appropriate Energy and Carbon Management Strategy, which will form the framework through which the Policy goals will be achieved.

The Strategy will be tailored to your specific needs and can cover a range of areas as appropriate:

- Energy and carbon measurement and reporting
- Energy and carbon reduction measures (e.g. energy efficiency, fuel selection, CHP)
- Energy and equipment procurement, standard specifications, supplier selection and the introduction of life-cycle costing concepts
- Incorporation of renewable energy technologies
- Staff training, awareness and motivation.
